Ind #2:: Wireframes for a New Website

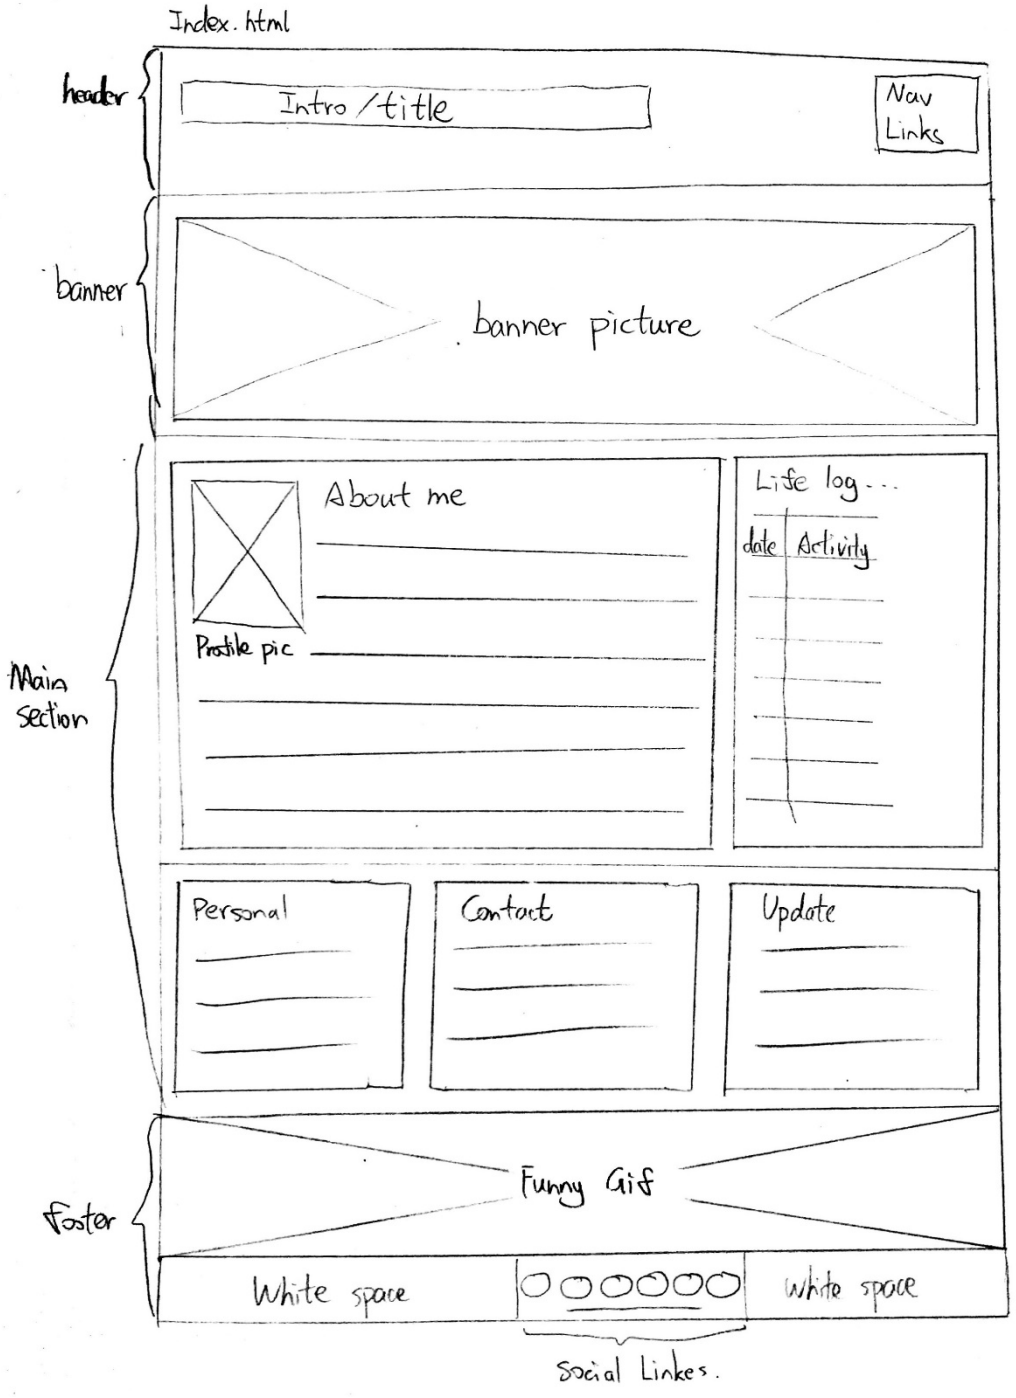

Website Vision

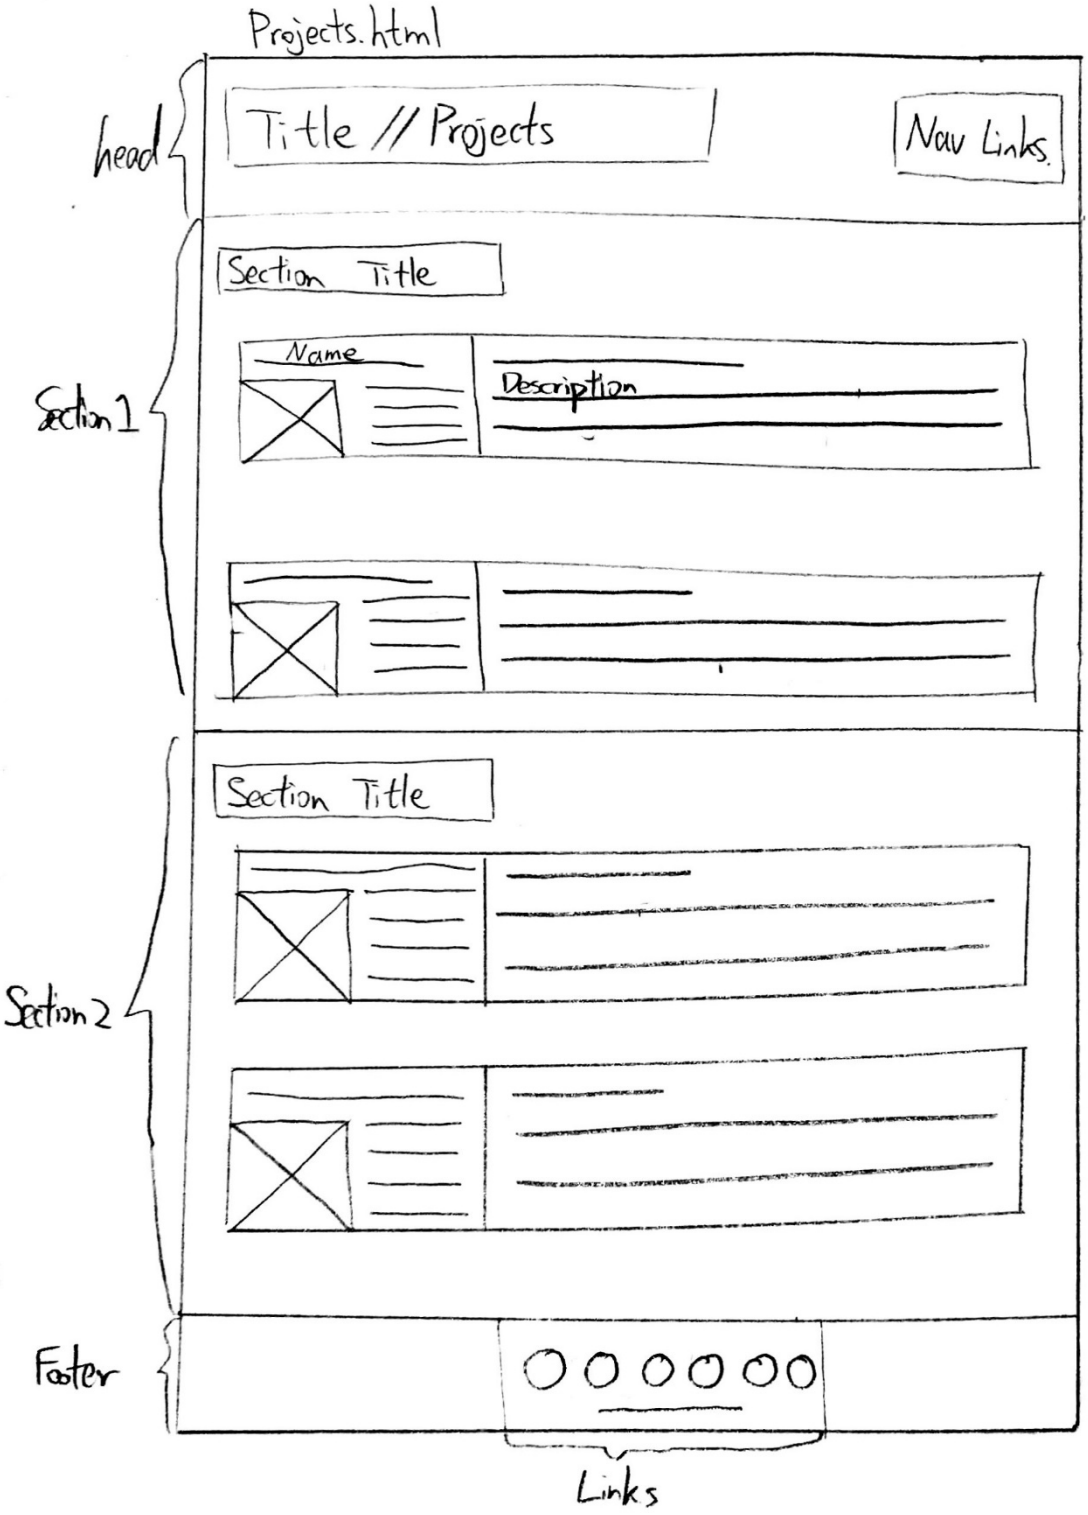

The aftermath of talking to a dozen companies during the TOC helped me realize that there is so much more about me that I can capture and showcase than what I have typed out on that page of 10px-font, single-spaced resume. From personal projects to artwork to potential blog posts, I want a website that can display and convey all this information to anyone interested, employers and friends alike. Therefore, it is my goal for this project to make a personal website that includes detailed information about my life, hobbies, and aspirations.

In active development

Cartpal

</> [React Native | Google Firebase | Heroku]

An iOS & Andriod app that aims to digitize the daily brick-and-mortar shopping experience for grocery store goers.

PyBookLib

</> [Python | Flask | Sklearn | NumPy]

A smart book recommendation web app that recommends books based on user taste instead of popularity.

Completed

stackjump

</> [Python | Pygame | tkinter]

Stack Jump game using Pygame with a smart AI that learns to auto jump by adapting its jump timing to incoming obstacles.

PySnap

</> [Python | openCV | Pillow | NumPy | tkinter]

A light-weight image processing program with built-in filters.

Font choice

I ended up picking three font types for my website – Josefin Sans, Merriweather, and Montserrat. For the title of my website, I wanted to convey a sense of light-heartedness, so I went with Josefin Sans, a sans-serif font that is playful and clever. For the main body of my website, where I write about myself and my experiences, I wanted to show the readers that I am serious about my endeavors and crafts, so I went with Merriweather, the typical serif font that is straightforward but also versatile. For the subject headers of my site, I decided to use another sans-serif font Montserrat because it pairs amazingly well with Merriweather, making the main paragraphs highly readable but still stylish.

Color harmonies

For my website, I initially wanted to go with a vibrant background color and white text because I thought that's the most attention grabbing. However, given the amount of information I wanted to convey through my website, this approach ended up looking terrible. I think a vibrant background color would only work for very few words/short sentences.

In the end, I decided to go with an off-white background color that's not too sharp and works well with hints of light-blue and light-green (when hovering) font colors I have on the website. This earthly combination looks perfect for my purpose, because I want to establish an image of stability, reliability, and abundance to my audience.
